ABOUT ME

My name is Bilal and I have done my Bachelor's in Geo-information system from Arid Agriculture University Pakistan. Currently, I am pursuing Copernicus Master in Digital Earth from Paris Lodron University of Salzburg and Palacký University of Olomouc. I have also 3 years of professional experience in GIS Domain. This portfolio represents my work that I have done in my master studies and made amazing maps using advance Cartographic techniques that represent different statistical information related to different region in the world.

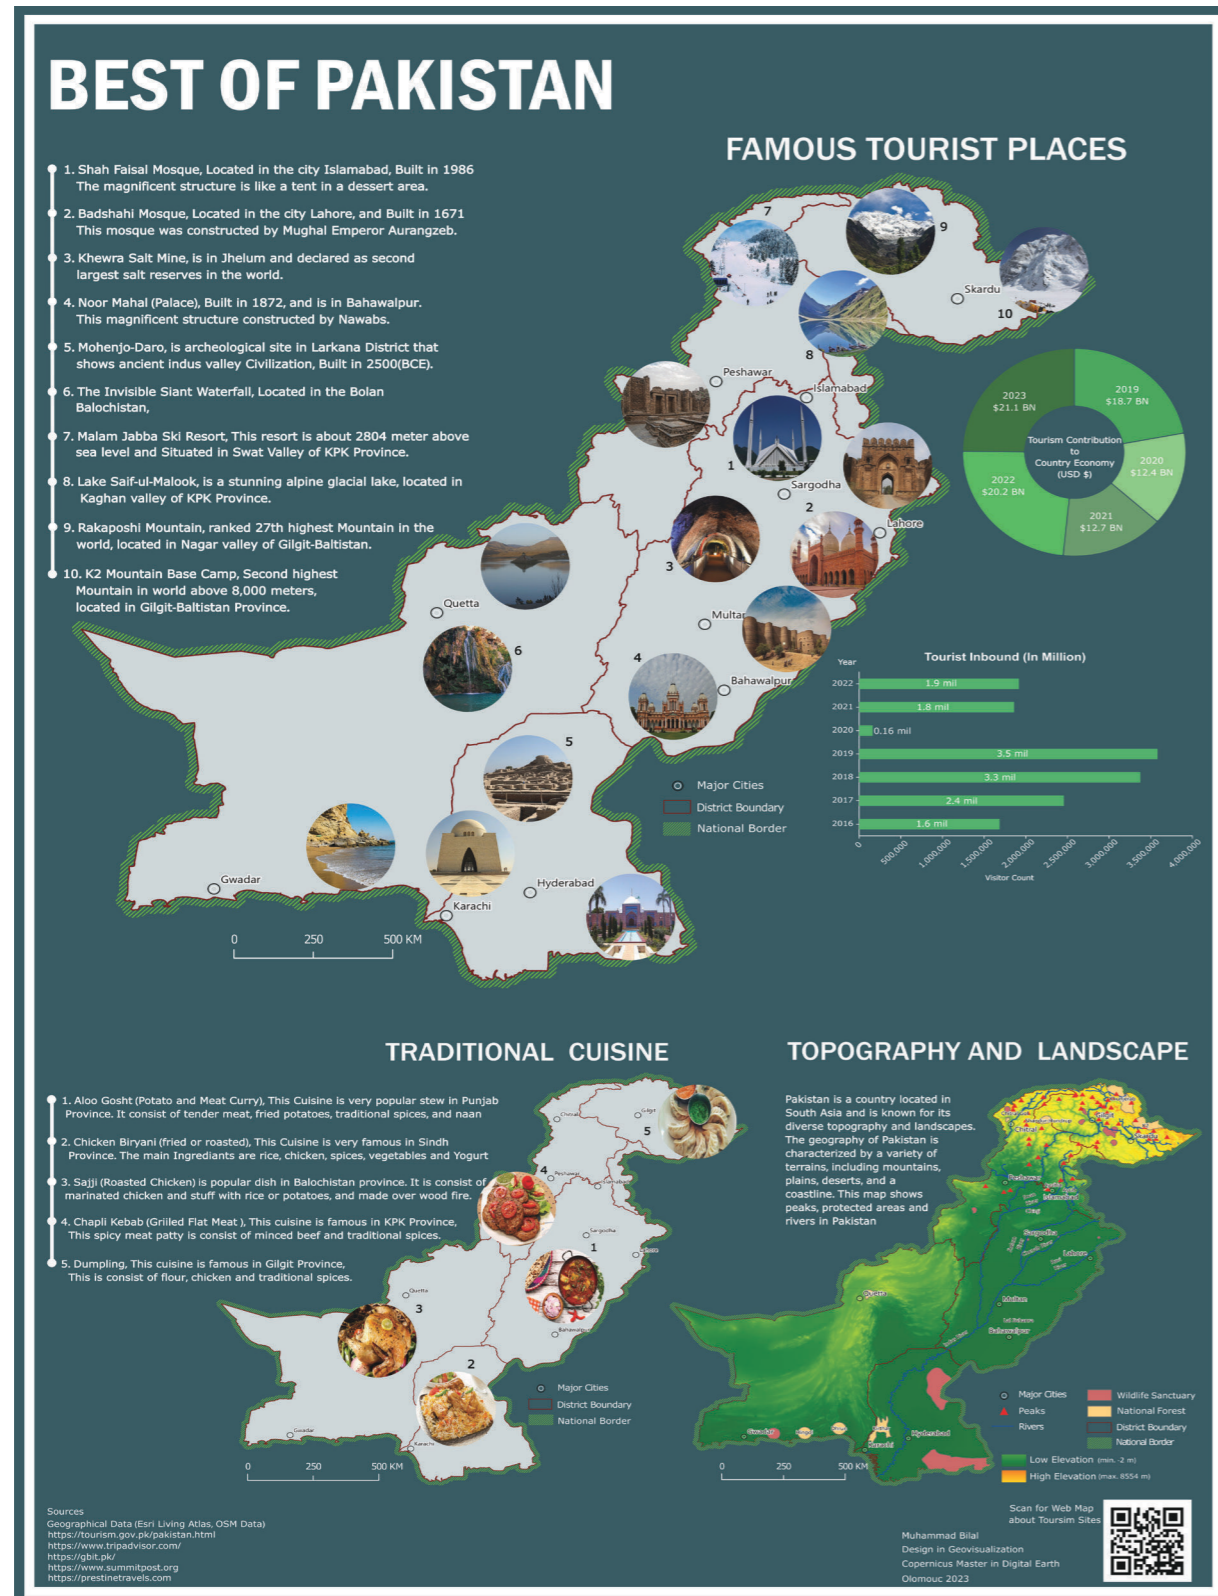

As a Master's student of the Geovisualization track, I am learning the advanced methods of visualization including infographics in the Design Geovisualization course and implementing them using Adobe Illustrator and Inkscape graphics software. I took a course on Thematic Cartography in which I learned the core concept and practical implementation of different thematic types like choropleth, Proportional symbols, and multivariate methods. Additionally, In the first year of my master's in Salzburg, I acquired knowlegde in Spatial analysis methods, cloud computing platforms, and machine learning and also did different projects in these domains.

DESIGN IN GEOVISUALIZATION POSTER

The Theme is to Introduce Pakistan visualize those things that this country is famous for like Tourism Places, Traditional Food and its beautiful landscape consist of mountains, deserts, and Coastlines. The main map is visualizing the famous tourist places consist of Archeological Sites, Old Castles, Lakes, Mountains, Religious Sites, Ski resorts, and their details. In graphics bar chart is showing the number of tourists that came to visit Pakistan for last 5 years.

The Second map visualize famous traditional cuisine that is popular in different region of Pakistan and third map visualize topography of Pakistan and different landscape features like peaks, National Forest, Wildlife Sanctuary, and Rivers. This Poster also embed by QR code that contain the link of ArcGIS Online Web map. The webmap help user to identify more details about tourist sites in an interactive manner.

Softwares that are used to make this Poster

Adobe illustrator

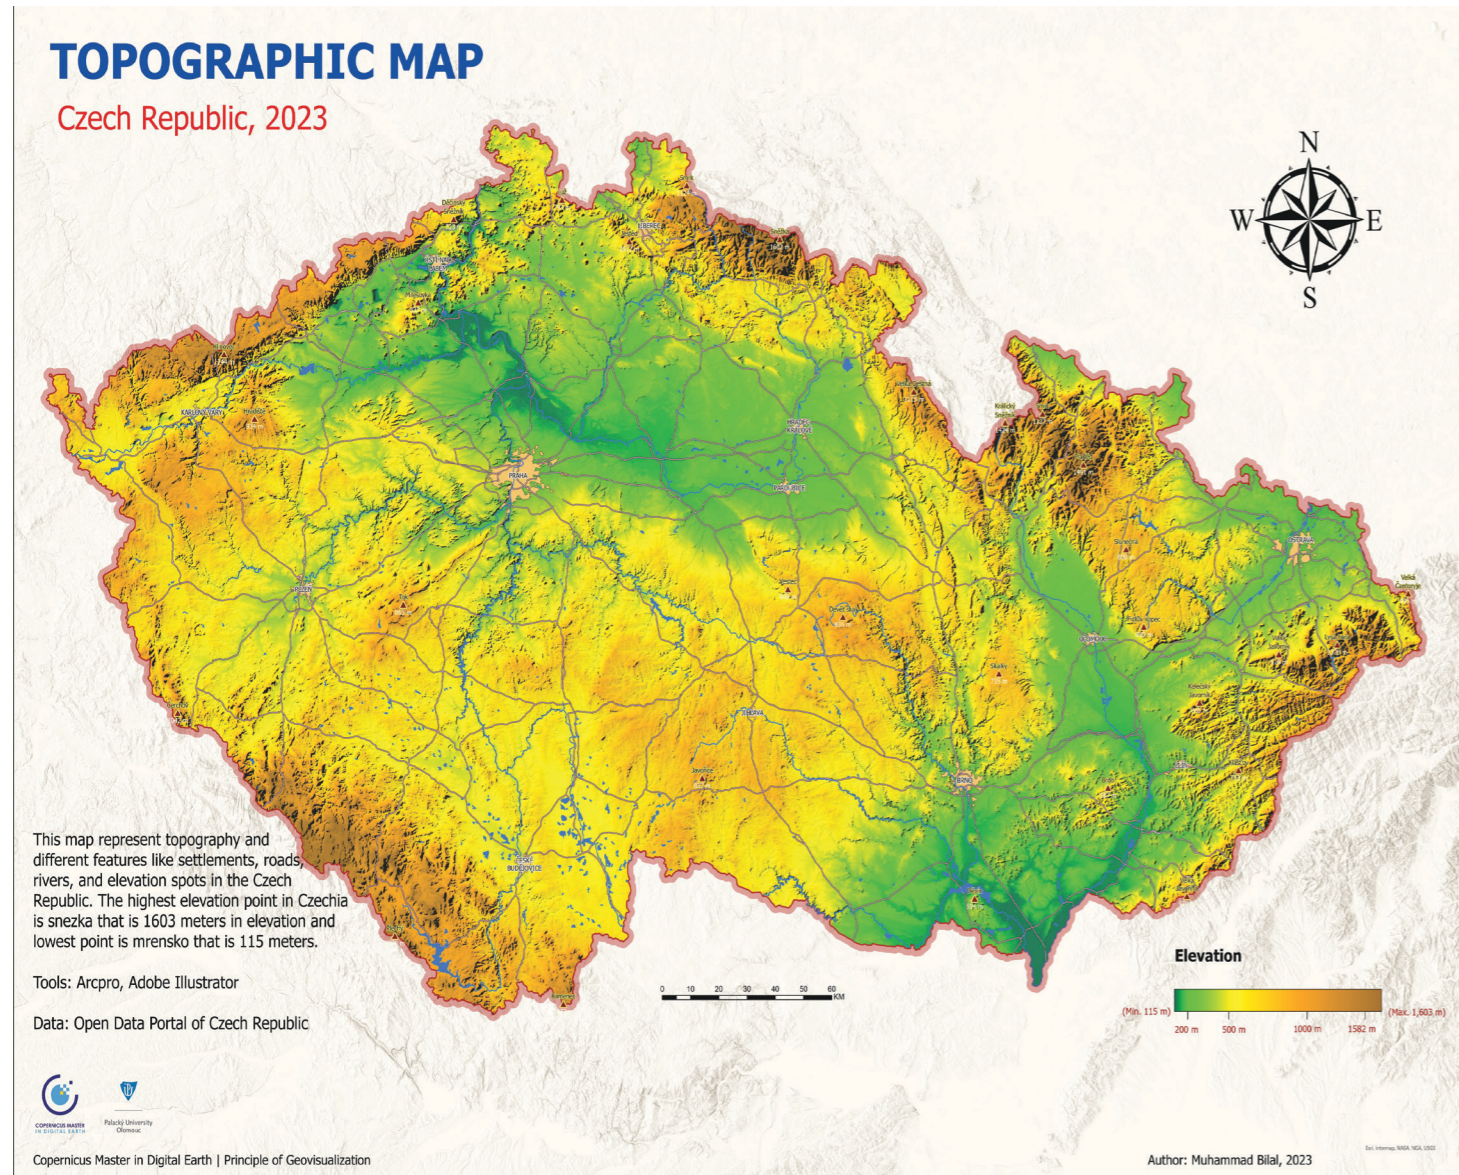

ArcGIS Pro

Inkscape

This Poster is made in Design in Geovisualization course by using maps and infographics, Copernicus Master in Digital Earth, 2023.

TOPOGRAPHIC MAP

This map is designed in Principle of Geovisualization course, Copernicus Master in Digital Earth, 2023.

This map visualizes the topographic surface and different features like stlement, roads, rivers, and elevation spots in the Czech Republic. The highest elevation point in Czechia is snezka that is 1603 meters in elevtion and lowest point is mrensko that is 115 meters. The darker brown areas represent high elevation and light green shows low elevation areas. This map is generated by integrating layers of river, settlement, roads and hillshade is used as background that gives a pseudo 3D look to the map.

Adobe illustrator

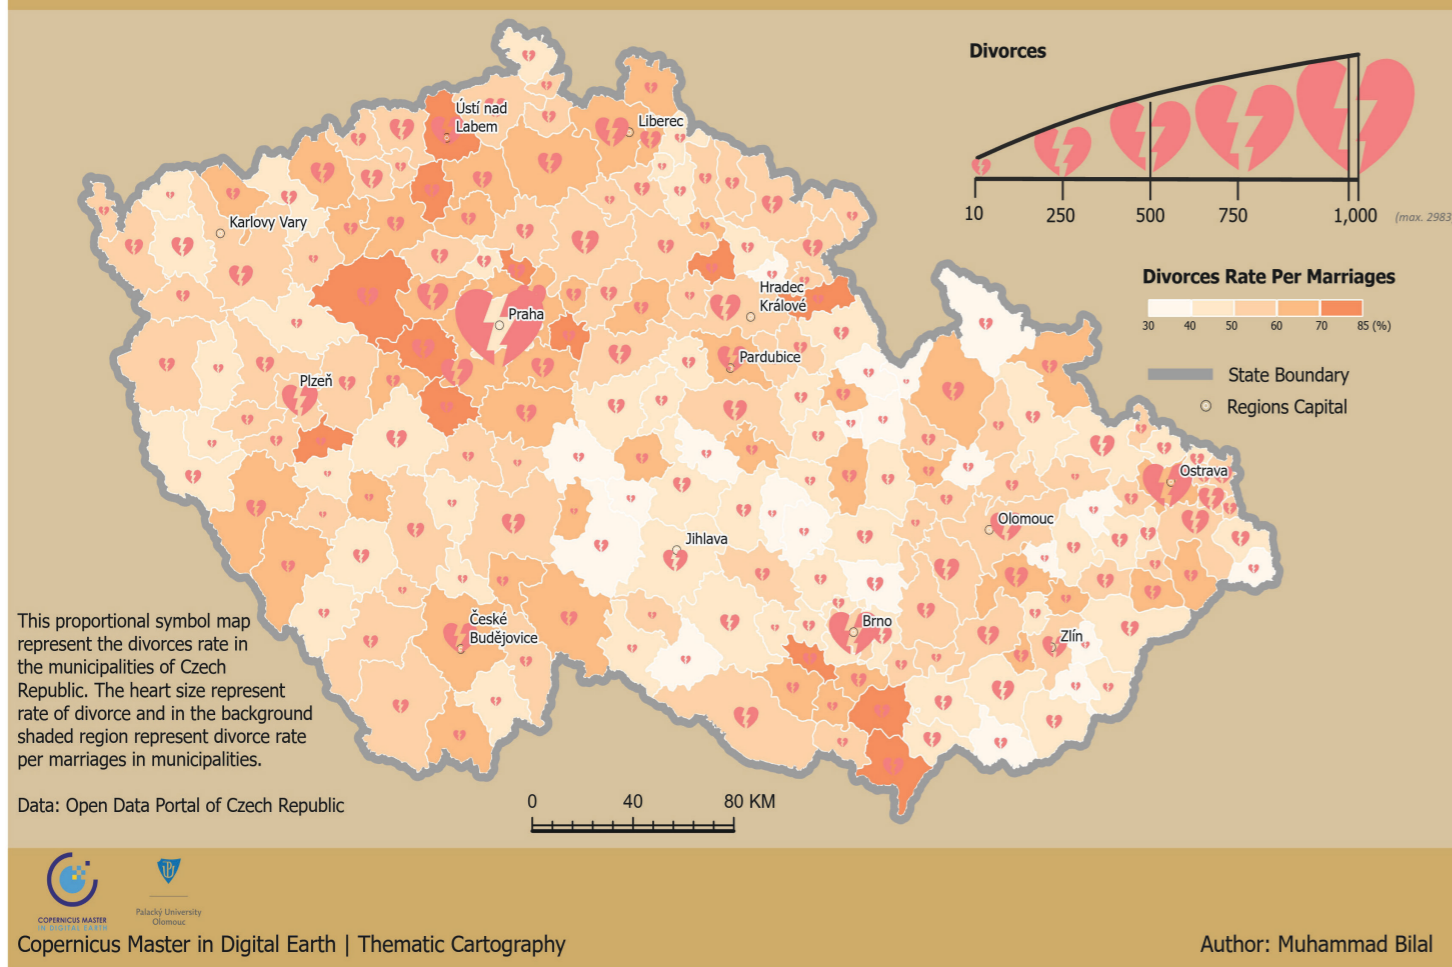

ArcGIS Pro

PROPORTIONAL SYMBOL MAP

DIVORCES IN THE CZECHIA

in municipalities with extended competences in 2023

This map is designed in Thematic Cartography course by using Proportional Symbol Method, Copernicus Master in Digital Earth, 2023

This proportional symbol map represent the divorces rate in the municipalities of Czech Republic. The heart size represent rate of divorce and in the background shaded region represent divorce rate per marriages in municipalities. The proportional symbol technique is a thematic map that scales the sizes of point symbols by their attribute values. This technique is useful for mapping economic SDG indicators as they evoke a metaphor of discrete and abrupt phenomenon, such as sites of production and distribution. Because of the strength of the visual variable size, readers can quickly assess the distribution of absolute values among different countries.

ArcGIS Pro

WURMAN DOT DENSITY

This map is designed in Thematic Cartography course by using Wurman Dot Density method, Copernicus Master in Digital Earth, 2023

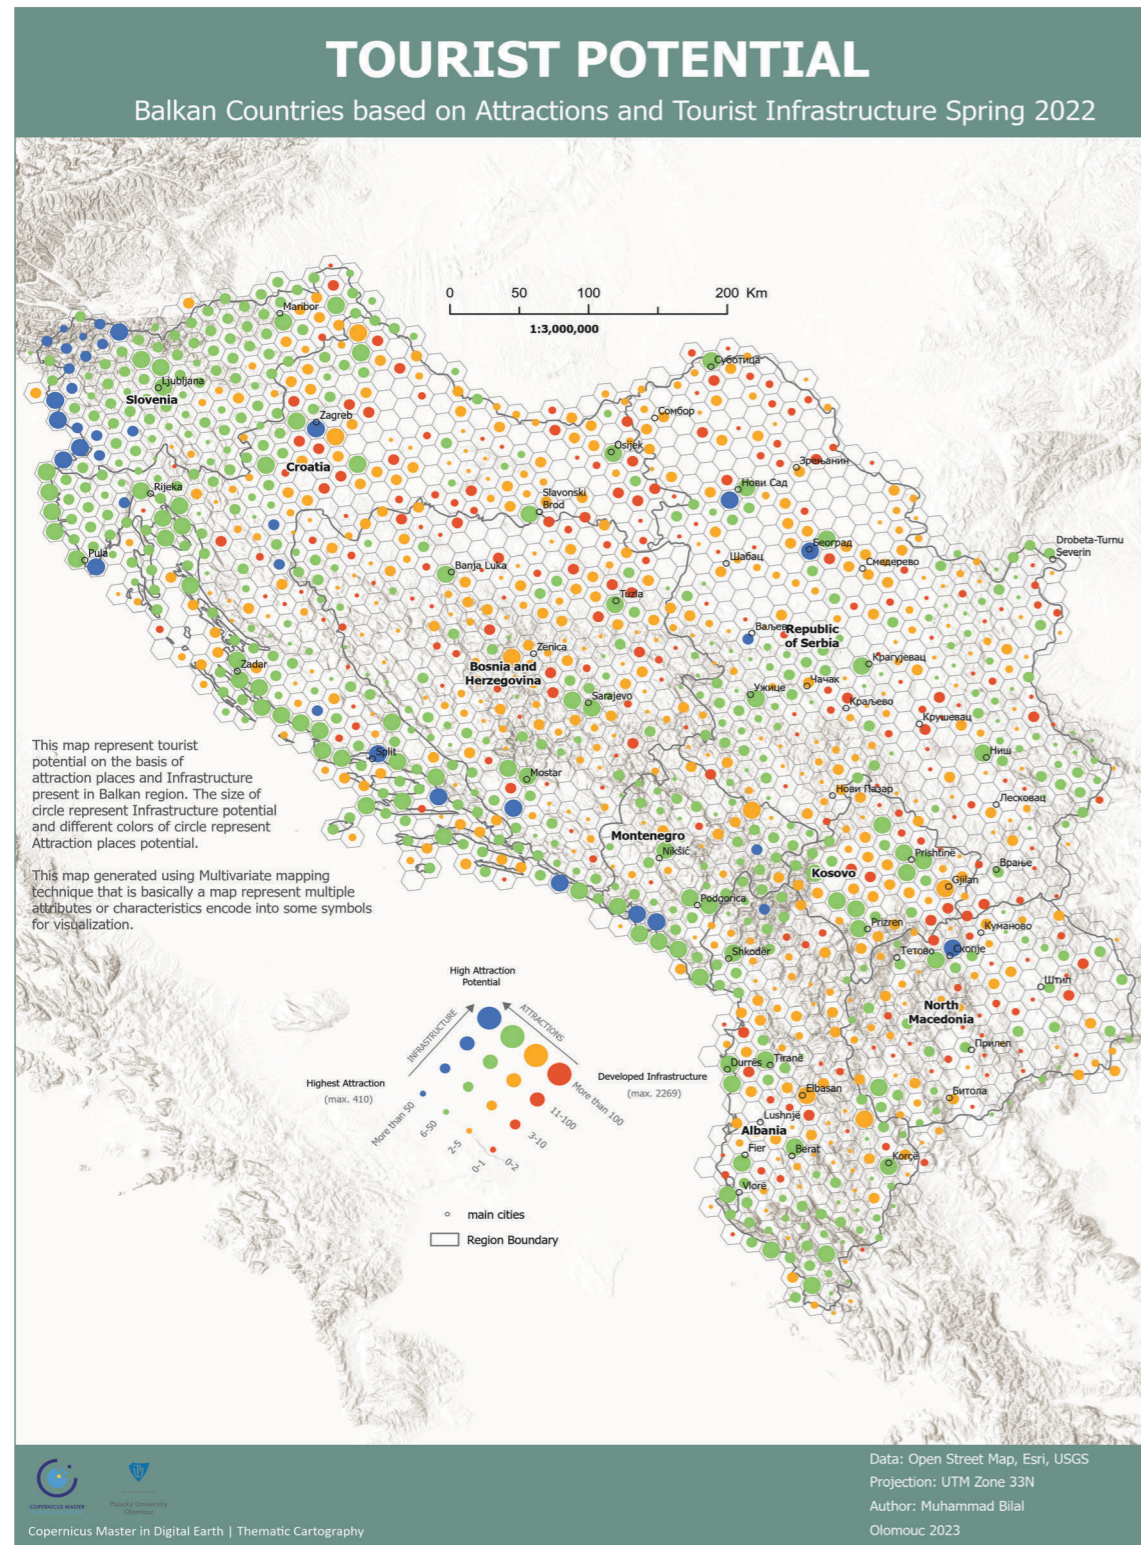

This map represent Internet Connection compared to Population Density in Czech Republic. The darker green color shows greater population and also the concentration of Internet connection is greater in those region. This map is created by using Wurman dots and choropleth method. The Wurman method is dot with graduating size in a regular grid of cells representing some phenomena and in the map that shows as Internet Connection. Choropleth method used graduated color schemes to represent some phenomena and in map it shows as population density.

MULTIVARIATE MAPPING

This map represent tourist potential on the basis of attraction places and Infrastructure present in Balkan region. The size of circle represent Infrastructure potential and different colors of circle represent Attraction places potential. This map generated using Multivariate mapping technique that is basically a map represent multiple attributes or characteristics encode into some symbols for visualization. This technique is powerful for visual interpretation of spatial patterns, particularly for comparing the spatial distribution of two or more potentially related Indicators.
